PROJECT

➤ Chatbot Disease Prediction.

Medical chatbot is built to be a conversational agent that motivates users to discuss their health issues and based on the symptoms provided by them. Chatbot returns the diagnosis. This chatbot system will be able to identify symptoms from user interaction.

The machine learning algorithm employed K-nearest neighbor algorithm (KNN). This clearly shows that a medical chatbot can somewhat accurately diagnose patients with simple symptom analysis and a conversational approach done with the help of natural language processing.

Declaration

- I hereby solemnly affirm that all the details provided above are true to the best of my knowledge belief.
